

Our quality and environmental management

Our goal: High quality standards of our products and a sense of responsibility towards our environment and society.

Our market and customer orientation

Satisfied customers are the basis of our success. Our core competencies lie in efficient sensor solutions whose high quality and availability are ensured throughout the entire product life cycle. In addition to the commitment to implement and continuously improve the quality and environmental management system according to ISO 9001 and ISO 14001, compliance with legal and normative requirements is a matter of course.

All processes in consulting, offer phase, development, production and service are continuously optimized to meet the requirements of the market and those of our customers as well as with regard to a resource-saving and proportionate handling of all energy sources at all times.

Our employees

Our aspiration is to actively shape progress today and in the future while acting sustainably. We ensure compliance with both legal and customer expectations and requirements through our corporate values and conformity with laws, regulations and standards.

We support the independent action of all employees in our team and attach particular importance to an open exchange among each other. Continuous training and learning as well as the willingness to change are key issues. Mutual appreciation, team spirit and togetherness, reliability and trust determine our actions among each other. These are important prerequisites for effective communication and customer perception.

Our processes and technologies

We are committed to the continuous analysis and improvement of our processes. In doing so, we assume responsibility for the sustainable protection of our environment through the use of future-oriented technologies, and a resource-conserving handling of primary and secondary materials.

Error prevention instead of error correction! Every identified risk offers the opportunity to implement suitable measures in order to improve and stabilize business processes. The use of state-of-the-art and proven technologies contributes to our high product quality and sustainable competitiveness.

We view our products, services and capital goods along the value chain with which we are familiar and optimize them throughout their life cycle. An important contribution is made here by our suppliers, who meet our quality and environmental requirements and who are themselves prepared to take over quality and environmental responsibility. In the case of investments and construction measures, the use of primary and secondary energies is generally examined.

This contribution is a matter of course for us with the aim of reducing the CO2 footprint of our products and processes.
